What is Tramadol?

Tramadol is a prescription opioid analgesic used to relieve moderate to severe pain. It works by:

- **Binding to opioid receptors** in the brain and spinal cord to reduce pain signals.
- **Increasing levels of serotonin and norepinephrine**, neurotransmitters that influence pain perception.

This dual mechanism makes Tramadol effective for both **nociceptive pain** (from tissue damage) and **neuropathic pain** (from nerve damage). Unlike stronger opioids, Tramadol carries a relatively lower risk of dependency when used correctly.

Common Uses of Tramadol

Tramadol is prescribed for a variety of human conditions, including:
